Louis Dalligos

Senior Software Engineer | Full-Stack

louisdalligos@outlook.com | Quezon City, Philippines
https://louisdalligos.github.io/

Professional Summary

Software engineer with over eight years of experience building web applications, APIs, and internal tools, mostly with TypeScript, React, Node.js, Python, PostgreSQL, and AWS. At DTN, built the Developer Portal where customers find weather, shipping, and financial data APIs and get API keys, and helped fix slow dashboards during a data pipeline redesign. Most recently, built a trading platform for a client that copies one trader's orders to many accounts in real time, keeps each customer's data private, and runs on AWS. Also builds AI tools that answer from a company's own data while leaving money decisions to fixed rules and people. Reviews code and enjoys tracking down production problems.

Professional Experience

Full-Stack Developer (Contract), *Independent Software Consultant / Freelance* 02/2026 - Present
Remote

- Built Edge Analyzer, a web platform the client's prop firm traders use to journal trades, track performance across accounts, and copy trades between accounts (Next.js, React, TypeScript, Supabase).
- Connected three broker platforms (Rithmic, ProjectX, Tradovate), each with its own protocol, and turned their order updates into one common format the rest of the system relies on.
- Built the copy trading engine: when a lead account's order fills, matching orders go to every follower account at once, after checking each account's position. Unknown positions are skipped, never guessed.
- Made sure only one server controls each broker connection at a time (Redis locks), which prevents duplicate real-money orders, and sent live updates to the browser (Server-Sent Events).
- Kept each customer's data private at the database level (PostgreSQL row-level security), encrypted stored broker passwords, and made billing safe to retry so a repeated payment notice is never counted twice (Paddle, Stripe).
- Built trade import from six platforms, profit and loss matching of buys and sells, and checks against each prop firm's rules, such as daily loss limits and profit targets.
- Passed Rithmic's API certification and compliance review to get production access, backed by automated tests (Vitest, Playwright) and a simulated broker for testing outside market hours.
- Moved the platform to AWS with Terraform for about $22 a month, with scheduled jobs, failure alerts, and releases that roll back on their own if the new version is unhealthy.

Software Engineer II, *DTN Philippines Inc.* 12/2020 - 02/2026
BGC, Taguig

- Investigated production issues, customer-reported errors, and slow pages with Datadog logs, including unavailable services and backed-up queues, on applications deployed to Kubernetes.
- Built REST APIs for business processes and new features with Node.js (Express) and Python (FastAPI).
- Worked with QA to reproduce reported issues, agree on fixes, and ship them through the team's sprints.
- Connected user-management APIs behind an API gateway to a Next.js/React frontend (TanStack Query, Axios), with Auth0 sign-in and role-based access.
- Planned and built DTN's Developer Portal and API catalog for weather, shipping, and financial data, including rate-limited trial keys and production keys tied to each customer's subscription.
- Improved dashboards showing API traffic, response times, error rates, and usage trends, so customers could track their plan limits and internal teams could monitor usage.
- Sped up the dashboard frontend as part of an AWS data pipeline redesign led by a solutions architect, after heavy log volume had made pages slow.
- Built reusable interface components, such as custom date and time pickers, for internal applications.
- Wrote technical documentation, API integration guides, and onboarding material; reviewed code and helped set JavaScript and TypeScript coding standards.

Frontend Developer, *NuWorks Interactive Labs Inc.* 09/2019 - 10/2020
Ortigas, Pasig City

- Turned UI/UX designs into responsive landing pages and marketing microsites for enterprise clients that worked the same across browsers.
- Worked with designers, backend engineers, QA specialists, and project managers to deliver projects in Agile teams.

Software Engineer (Frontend), *Sprout Solutions Philippines, Inc.* 07/2018 - 08/2019
BGC, Taguig

- Built reusable, accessible React components for an HR and payroll platform.
- Connected the interface to APIs for salary calculations, tax deductions, payslips, and employee records.
- Improved how pages fetch data, and built responsive layouts with Bootstrap and Material UI.

Selected Projects

Support Copilot, *Python*, *Claude*, *LangGraph*, *MCP*, *AWS* github.com/louisdalligos/support-copilot

- AI assistant that drafts customer support replies from a store's policies, with sources, and proposes refunds for a person to approve. Refund amounts come from fixed business rules, so the AI cannot be talked into paying out.
- Tested on labeled cases: found a relevant policy in its top five results for all 48 test questions, made 0 unsafe decisions on 36 test tickets, and blocked all 16 attempts to trick it.

Enrollment Desk, *Python*, *AWS Step Functions*, *Lambda*, *Terraform* github.com/louisdalligos/enrollment-desk

- Turns messy HR employee lists into clean records an insurer accepts, using clear rules, a person's review for unclear cases, and automatic retries; tested on 100 sample requests.

Education

Bachelor of Science in Computer Science, *Holy Angel University*

Core Skills

Backend & integrations
TypeScript, JavaScript, Node.js, NestJS, Express, Python, FastAPI, REST APIs, WebSockets, Server-Sent Events; Shopify, Zendesk, Stripe, Paddle

Data & caching
PostgreSQL, MySQL, Redis and Valkey, Supabase (Auth, Storage, row-level security), Prisma, pgvector

Cloud & delivery
AWS (EC2, S3, SQS, Lambda, Step Functions, EventBridge, CloudFront), Terraform, Docker, Kubernetes, GitHub Actions, GitLab CI/CD, Datadog, Sentry

Identity & security
Auth0, OAuth 2.0, role-based access (RBAC), JWT, MFA, AES-256 encryption, GDPR compliance

Testing & teamwork
Jest, Vitest, pytest, Cypress, Playwright, Git, Agile/Scrum

Frontend
React, Next.js, Tailwind CSS, shadcn/ui, TanStack Query, Axios, Redux, Recoil

AI applications
Claude API, LLM APIs, LangGraph, LangChain, RAG, embeddings, vector search, tool calling, AI evaluation and safety testing

AI tooling & deployment
Custom MCP servers, Hugging Face models, Arize Phoenix tracing, Amazon Bedrock, Docker, AWS; Claude Code, Cursor

Certifications

Python Programming Fundamentals, Microsoft | Issued Jan 2026 | Credential ID 5E47W0V0CEL4
Introduction to Software Engineering, IBM | Issued Jan 2026 | Credential ID 7INTX8GS25AM
